## Watering Schedule-

### Trees-

- *Balled & Burlaped- Water these larger trees once every 7-10 days. Barely turn the hose on to let it “dribble” near the trunk for 10-20 minutes. If watering multiples, it’s a good idea to set a timer.*
- *½” or more of rain during the week would be considered enough to water them fully for that week.*
- *It may take one complete season to establish enough roots. It is advised to water during very hot and dry periods the second year.*

### Shrubs-

- *Potted and Balled & Burlaped- Just like the potted trees above, these need to be watered approximately 2 times per week and let the hose dribble for 3-5 minutes.*
- *Typically, the smaller the plant the more often it needs to be watered*

### Perennials-

- *Most perennials should be watered more often than trees and shrubs. 2-3 times per week is recommended and takes approximately 1-2 minutes with a dribbling hose.*

### Lawns-

- *Newly planted lawns and lawn patches need to be watered daily unless they receive ¼” or more of rainfall per day.*
- *If using a sprinkler, water until soil is moist, but do not puddles to form.*
- *If using hoses and portable sprinklers, the hose should be moved daily to avoid grassless tracks.*
- *It is recommended to fertilize at least once about 2-4 weeks after the seed was planted. A high quality fertilizer is recommended.*
